19	Walkers Pond	Boat at deepest point in pond	October 13	Acceptable	No

1. This report includes observations and sampling by the BPC Citizen Science team from their bi-weekly observation program, as well as observations by the Brewster Health Department or others.
2. Any observations by BPC or other observers suggesting the presence of a cyanobacteria bloom are reported to the Brewster Health Department, with photographs and specific locations. The APCC lab also receives and analyzes BPC water samples and communicates results to the Health Department.
3. **The Brewster Health Department quickly visits any pond with observations or tests that show potential concerns. Based on their visual observations and data received, they decide whether a pond is acceptable for recreation or a "Recreational Advisory" notice should be posted, following Massachusetts Department of Public Health criteria.**
4. Advisories are only posted at public beaches or landings or at pond association beaches where access has been granted. The Brewster Health Department does not do observations or post advisories at private homes or locations that are not used for public access. Private access ponds are included above for information purposes.
